

Automated Company Data Lookup via Slack & Clay Integration

Workflow Objective:

Streamline how Account Executives and SDRs access enriched company data directly from Slack.

How It Works:

When an Account Executive or SDR posts a company domain in a designated Slack channel, the automation captures that domain and searches for a matching record in the **Clay Enrichment Table**.

This table contains valuable company insights such as:

- Company description & product overview
- Target job titles
- Email sequences
- Intent scores & G2 data
- Product proposal details
- & More

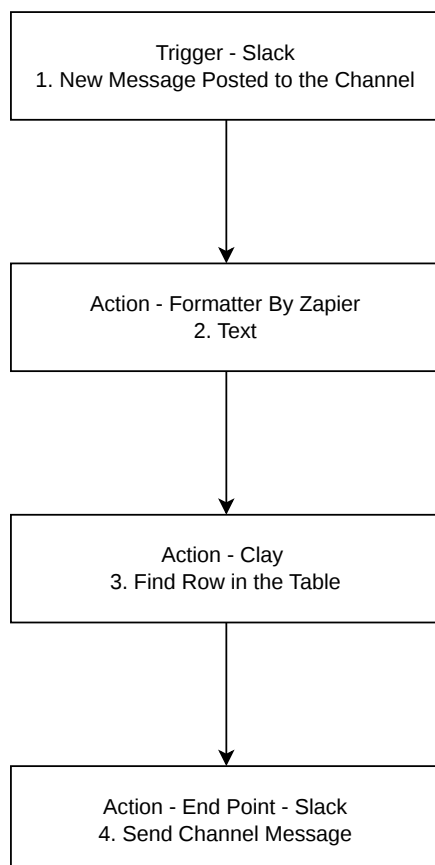

If a match is found, the automation instantly returns the company's enrichment data back to the Slack channel for quick visibility.

Notes & Iteration Points:

- The workflow currently only retrieves records already existing in the Clay workbook (manual domain input required).
- Direct posting to a public Slack channel was paused due to compliance and privacy considerations — next iteration will refine data access rules.

Tools Used:

Slack | Clay | Zapier (or similar automation platform)

⚙️ Automated Record Creation & Data Enrichment via Slack + Clay

Workflow Objective:

Automate the process of adding and enriching new company records in **Clay** directly from Slack — empowering SDRs and Account Executives to access key insights instantly without switching tools.

How It Works:

When an **Account Executive** or **SDR** posts a **company domain** in a designated Slack channel, the automation triggers the following steps:

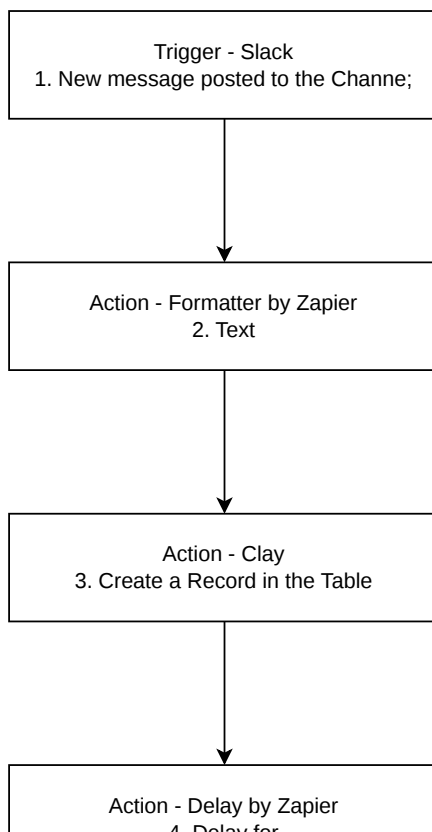

1. Captures the posted domain.
2. **Creates a new record** for that domain in the **Clay Enrichment Table**.
3. Enriches the record with company intelligence, including:
 - Company description and overview
 - Product proposal and related data
 - Target job titles & relevant contacts
 - G2 data, intent score, and other engagement signals
 - Predefined email sequences and messaging templates
 - & More
4. Fetches the enriched data and sends a summary back to Slack for quick access.

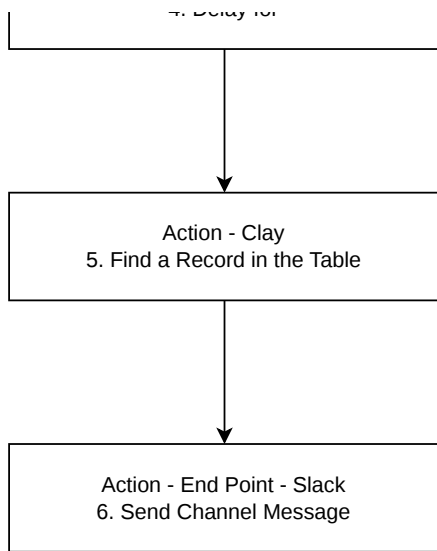

Notes & Iteration Points :

- Currently, the workflow does **not validate for existing records** in Clay, which can result in **duplicate entries** for the same domain.
- Posting enriched insights directly in the Slack channel raised **compliance issues**, since the data becomes visible to all channel members.
- Next version will include **duplicate-check logic** and **restricted message delivery** (e.g., private Slack messages or dedicated data thread).

Slack | Clay | Zapier (or similar automation platform)

Automated “Find or Create Record” Workflow – Slack + Clay + Zapier

Workflow Objective:

Automate the process of identifying, creating, and enriching company records in **Clay** directly from **Slack**, while ensuring no duplicate entries and maintaining data privacy.

How It Works:

When an **Account Executive (AE)** or **Sales Development Representative (SDR)** posts a **company domain** in a designated Slack channel, the automation triggers and runs through two smart paths:

1. Path A – Record Found:

- The system searches the **Clay Enrichment Table** for an existing record matching the posted domain.
- If found, it instantly retrieves the company's enriched data (description, product info, intent scores, G2 data, etc.).
- The data is then sent **privately via Direct Message (DM)** to the respective AE or SDR — not to the public channel — ensuring **data confidentiality**.

2. Path B – Record Not Found:

- If no existing record is found, the automation **creates a new record** in Clay for that domain.
- After a short delay (to allow Clay to enrich the record), it then retrieves the newly added data.
- The enriched data is again sent **directly to the user's DM**, maintaining privacy and avoiding channel clutter.

Results & Benefits:

- ✅ **Eliminated duplication** — the automation checks for existing records before creation.
- ✅ **Resolved compliance issues** — insights are sent privately instead of public channel posts.
- ✅ **Reduced manual work** — AEs and SDRs can enrich accounts instantly without leaving Slack.
- ✅ **Improved workflow efficiency** — one seamless flow for both finding and creating records.
